

**Virtual live hands on PLC or HMI training courses**  
 InterConnecting Automation (ICA) has been providing in-person PLC and HMI training around the country for decades. Now, ICA is offering the same real-world training as the in-person classes but in a virtual/remote format so that anyone can attend regardless of their location. These virtual classes feature live online lessons with Doug Bell and real-time programming, testing, and troubleshooting of actual PLC or HMI hardware using free programming software, a trainer interface, and a webcam.

"We have developed live online 'Hands On' training courses to better serve you. **No need to travel, you get the same high quality training direct from your home or office.**"

*Doug Bell, ICA Founder*

- The same quality PLC or HMI training as in-person classes accessed remotely from your location
- No hassles and expense of travelling (airfare, hotel, food, etc.)
- Small classes with plenty of opportunities to ask questions during and after the session
- 4 hours of instruction per day instead of 8 for better comprehension
- Each student uses their own workstation with PLC/HMI trainer and webcam
- Customized classes available for your company on any topic
  - Small group classes of 4 or more employees for your company only

# LIVE REMOTE HANDS ON PLC/HMI TRAINING

## Virtual live training courses

### Who should attend?

Manufacturing Engineers, Industrial Engineers, Plant Operations Managers, Maintenance Personnel or other personnel involved in planning, design and setup of manufacturing facilities and personnel who encounter control systems in their course of daily functions. It will also benefit those who might be programming, installing equipment, maintaining equipment, purchasing or implementing cost reduction and automation programs, or maintaining and troubleshooting equipment. Finally, this class will benefit the home user or tinkerer trying to implement their own systems.

### What are the Benefits?

Plenty of Hands-on! There is NO BETTER WAY to learn industrial controls than to dig in and start programming. From DAY ONE you will be learning how to configure, specify, program and troubleshoot a REAL PLC control system and/or HMI! The instructor draws on his diverse background to make the examples reflect REAL-WORLD situations in such a manner that will keep you interested throughout the entire course. At the end of the course you'll have a library of code to keep and use to implement in your future projects.

**Industrial hardware is not required to attend the course. We provide it. Windows OS computer and high speed internet connection is all the gear you need on your end.**
